SUMMARY

Software engineer at Goldman Sachs building automated code-remediation and verification systems for production financial infrastructure, where correctness and auditability are non-negotiable. B.Tech in Computer Science and Applied Mathematics, IIT-Delhi; published at ACM TEI '24.

EXPERIENCE

Software Analyst

Goldman Sachs, Global Banking & Markets

Jul 2025 – Present

Bengaluru, India

- Built an automated remediation pipeline that closes technology-risk findings across production applications: the system locates the affected code, applies the change, and validates it end-to-end in the QA environment with minimal human intervention.
- Cut the QA validation cycle for a remediation from roughly one week to a couple of hours by replacing manual regression passes with automated test execution and result triage.
- Engineered the pipeline in Java and Spring Boot with Python tooling, applying automated code transformation behind a verification gate so that no change reaches QA unvalidated.
- Deployed the pipeline across a dozen production applications to date.

Summer Analyst

Goldman Sachs, Global Banking & Markets

May 2024 – Jul 2024

Bengaluru, India

- Built a message search-and-replay monitor for securities lending systems, reducing issue turnaround from over an hour to under five minutes and converting a manual investigation into a self-service tool.

SKILLS

Languages: Java, Python, C/C++, SQL, Swift, JavaScript

Backend: Spring, Spring Boot, REST APIs, automated testing, CI

Data & Messaging: Apache Kafka, IBM Db2, Sybase

ML & Automation: PyTorch, Hugging Face Transformers, automated code transformation, evaluation harness design, ROS 2

Domain: Securities lending and securities finance, regulated production environments, technology risk remediation

EDUCATION

B.Tech, Computer Science and Applied Mathematics

Indraprastha Institute of Information Technology Delhi (IIIT-Delhi)

Jan 2022 – 2025

CGPA: 8.43/10

PUBLICATION

Saumik Shashwat*, Aditya Padmagirwar*, **Shivroy Arora***, Anmol Srivastava. “KaavadBits: Exploring Tangible Interactive Storytelling of Branching Narratives through a Kaavad-inspired Installation.” (**equal contribution*)

TEI '24: Eighteenth International Conference on Tangible, Embedded, and Embodied Interaction. Cork, Ireland, February 2024. doi.org/10.1145/3623509.3635251

Tabletop installation for branching-narrative storytelling via multi-modal physical interaction (Python, Arduino, Raspberry Pi).

SELECTED PROJECTS

ROS 2 Autonomous Navigation

2026

Stack: ROS 2, Nav2, Gazebo, Python

Differential-drive robot performing LiDAR-based mapping and autonomous navigation: wall-following control, SLAM map construction, and Nav2 path planning, with a synthetic LaserScan publisher written to work around headless GPU limits on Apple Silicon.

Transformer Fine-Tuning for Review Rating Prediction

2026

Stack: Python, PyTorch, Hugging Face Transformers

Fine-tuned RecipeBERT for 5-class rating prediction on 60k class-balanced reviews via gradual layerwise unfreezing: 0.90 accuracy and 0.90 macro-F1, against 0.61 for fine-tuned BERT and 0.55 for TF-IDF across four baselines.

StrikeOut — iOS task manager

2022

Stack: SwiftUI, AVFoundation

Shipped to the App Store with 400+ downloads; custom notification audio, user-defined themes, quantity-tracked list items.

github.com/arorashivoy/StrikeOut

AWARDS

Track Winner, RedBrickHacks (Ashoka University) · 2nd Runner-up, DecodeEV Hackathon (WUElev8) · 1st Runner-up, Green India Hackathon
